

Databricks is my data management system

Catalog is the data warehouse

^{Sampled}
^{Backhaul} Workspace is the database

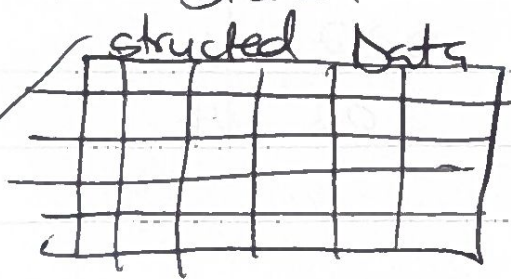

Default is the schema
then table

In one data warehouse you can have multiple databases

In one database you can have multiple schemas

In one schema you can have multiple tables

Data is stored in table (rows & columns)

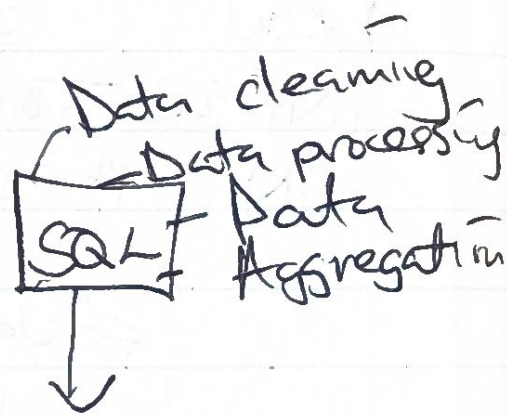

~~Structured~~ Structured Query Language (SQL)

We use it to extract insights from our data

• We use SQL for structured data → it is data in a table.

• Insights from data is key information that help us to make decision based on data.

Big Data → Large volume of data

Aggregate data
Summarizing
data

features
