

- Decimal $\rightarrow$ stores exact decimal number with fixed precision
 $\text{Decimal}(m, d) \rightarrow \text{Decimal}(8, 2)$
 $M = \text{total Digits}$
 $D = \text{Decimal places}$

Data and Time data types

Year $\rightarrow$ store a year value

Date $\rightarrow$ store date in format (YY-MM-DD)

Time $\rightarrow$ store time in format (HH:MM:SS)

Datetime $\rightarrow$ store both date and time (DATETIME)

Timestamp $\rightarrow$ Often used to store created time

Useful for tracking insert time

Column Constraints

- Not null $\rightarrow$ value required

Unique $\rightarrow$ all values different

Default $\rightarrow$ use present values if no value is given

primary key $\rightarrow$ uniquely identifies the ^{each} row

Auto-Increment $\rightarrow$ value increases automatically for each row

Example: create table sales

Event Date Timestamp (not null) ~~Default~~ ~~be null~~
 Default Now()

Key and relationships

- Primary key uniquely identifies each row
- Foreign key It links one table to the primary key of another table
