

You can declare a variable by starting with an underscore

9/6/2020 Python fundamental

- Variables are case-sensitive

Gender = 'Male'
gender = 'female'
GENDER = 'Gay'

These are three different variable names

A variable name cannot be a python keyword or function

Use variable names that are descriptive and are not

def
import

python functions

A variable name should be ~~def~~ defined based on the kind of data that it holds

Ways of Variable Naming

① Camel case

- Each word, except the first letter starts with a capital letter

~~my~~ myCarName = 'Suzuki'

② Pascal Case

- Each word starts with a capital letter

MyNameSurname = 'Rofhi Nomi'

③ Snake Case

Separate each word by underscore

my_name_surname = Rofhi-Nomi
