

- Split () - separate words by a comma

On the name of a variable, we do not put single or double quotes

```
name_surname = "Rofhiwa Nemukula"  
len(name_surname)  
16
```

Upper () = changes the values in a variable into upper case  
print (name\_surname.upper()) R~~OFHIWA~~ NEMUKULA

lower () = changes the values in a variable into lower case  
print (name\_surname.lower()) rofhiwa nemukula

```
mixit_name = "Rofhiwa"
```

```
print (mixit_name.upper())
```

```
print (mixit_name.lower())
```

Mapping type

What is a dictionary in Python.

- It is used to store key : value pairs

Left-side you have the key and on the right-side you have the value

```
my_profile = {  
    "name": "Rimrose",  
    "Surname": "Mukwasha",  
    "Age": 31,  
    "Location": "USA"
```
